

Murray River Upper Catchment Willow Mapping and Monitoring

The Murray River willow mapping and monitoring project is part of the Willows out of Our Rivers project that is mapping willows by taxa across South East NSW to update the data available of willow distribution. At the same time where resources are available Black Willows and Grey Sallow Willows are being treated where we have landowner consent. If we find evidence that other willows are seeding we will also be helping landowners with managing these willows where resources are available.

Work has not commenced on this project.
